Mathematical analysis i. the last fact differs this book positively from many traditional expositions and is of great importance especially in connection with the applied character of the future activity of the majority of students. this two-volume work presents a well thought-out and thoroughly written first course in analysis, mathematical education and in science in general. the textbook exposes classical analysis as it is today, as an integral part of the unified mathematics, in its interrelations with other modern mathematical courses such as algebra, differential geometry, differential equations, complex and functional analysis. the first volume constitutes a complete course in one-variable calculus along with the multivariable differential calculus elucidated in an up-to-date, clear manner, with a pleasant geometric and natural sciences flavor. vladimir a. zorich is professor of mathematics at moscow state university. vladimir a. zorich is professor of mathematics at moscow state university. his areas of specialization are analysis, conformal geometry, quasiconformal mappings, and mathematical aspects of thermodynamics. he solved the problem of global homeomorphism for space quasiconformal mappings. european mathematical society newsletter, sept. 2004, p. 47 "this is the translation of the fourth edition of a well known course on mathematical analysis, taught for several years by the author at the moscow state university (msu) and at other universities. vladimir antonovich zorich is a soviet and russian mathematician, doctor of physical and mathematical sciences, professor. honorary professor of moscow state university. books by vladimir a. zorich
